ButtonBrew: Some tools to help you jailbreak your "The Button" device!

Detailed ButtonBrew description:
ButtonBrew is a set of tools similar to the Wii HBC, but for The Button.
The Button specs for Homebrew devs:
- 150mAh battery
- 128x64 OLED screen
- 32-bit RISC-V single-core processor with 400 KB SRAM (ESP32-C3)
- 4 buttons

ButtonBrew tools:
1. ButtonMod: ButtonMod is a modification of the original The Button firmware to use BrewApps instead of ButtonAppStore.
2. BrewFirmware: BrewFirmware is a reimplementation of The Button firmware.
3. BrewApps: Equivalent to the Open Shop Channel on the Wii homebrew side.

For more info about specific tools go to the next pages.
ButtonMod: just use the original The Button userguide. It's similar enough.

BrewFirmware:
Button A,B,C,D will be referred to as B1,B2,B3,B4 respectively.

In the BrewFirmware main menu, click B1 to open Apps. This will show currently installed ButtonAppStore Lua apps and ButtonBrew apps.

In the BrewFirmware main menu, click B2 to open BrewApps. This acts as a shortcut for Apps → BrewApps.

In the BrewFirmware main menu, click B3 to restart The Button.
B4 is unused in the main menu.

To select something from a list, you can use B3 as up, and B4 as down. Also note B1 is "Select" and B2 is "Cancel"

To answer the Y/N prompt, use B1 to select "yes" and B2 to select "no" B3 and B4 are unused here.

... That's about it, The Button has so little stuff.

BrewApps:

BrewApps is an alternative to ButtonAppStore.

BrewApps is very similar to ButtonAppStore, but with almost no restrictions on what to put here, even rival apps to The Button apps! The only rules: No NSFW on title and description, but app content NSFW is allowed as long as you add a warning on the description AND title, and no malicious apps (e.g. zeroing out flash).

Apps can come in ELF files (if using Rust for example) or Lua.
